## DETAILED ACTION

### *Drawings*

Figures 1-4 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-8 are rejected under 35 U.S.C. 102(e) as being anticipated by Takeguchi et al (US006567422B1).

Regarding claims 1 & 5, Takeguchi discloses a communications system comprising a plurality of interconnected network elements (NE), in which each NE comprises one or more ports, each port for inputting from an adjacent one of the plurality of NEs a synchronisation signal and a quality level indication (QLI) for indicating the quality of the source of the synchronization signal (**abstract, Figs1, 2, 14 & 15**);  
each port for outputting to the adjacent NE a selected one of the input synchronization signals and a QLI (**col 2 L45**);

in which each NE is associated with a unique NE identifier (**claim 2**);  
in which each port of each NE is associated with a source identifier (SID) for identifying the port at which each synchronization signal is input (**col 8 L4-33**);  
in which each port of each NE comprises QLI means for setting the value of the QLI output at that port based on a comparison of the SID of that port with the SID of the selected synchronization signal input port (**claim 4**);  
and in which the SID of each port comprises the NE identifier of the adjacent NE (**claim 2**).

Regarding claim(s) 2 & 6, Takeguchi discloses a central management means, in which the management means comprises means for setting the SID of each port of each NE to the appropriate NE identifier value (**Fig 11; col 9 L30-65**).

Regarding claim(s) 3 & 7, Takeguchi discloses each NE comprises sending means for sending its own NE identifier to each NE to which it is directly connected (**Figs 3 & 7, col 5 L14-35**).

Regarding claim(s) 4 & 8, Takeguchi discloses sending of NE identifier again based on ring failure (**Fig 1**).
